

California Drought

The California drought is a problem that California has been dealing with for a while. California is known to be a dry region, with less cold rainy days than sunny and hot. It is important to know the facts about the California drought in order to be informed about how we can help. In the statistics region of the California drought data, the center of California isn't affected as much as the outer areas of California. More of the northern and southern areas of Cali are affected by the drought. As this is a problem, it can become a life-threatening problem. If it is too dry, it can affect the way crops are being grown and how food is being produced.

D0- is the yellow data that shows abnormally dry soil.
